

VisionFund International

Core Credit Impact Report — Cupboard Week Template · v2.0

How to use this template

This report is carried by written analysis supported by dashboard visuals. Tables are used only where a comparison genuinely needs a grid. The nine theme sections follow the Core Credit Impact Dashboard's Golden Framework and map one-to-one to its pages, so visuals drop straight in. Each subsection follows the same rhythm:

1. Dashboard visual — extracted from PowerBI. The PowerBI Core Credit Impact Dashboard is the single source of truth.
2. Analysis — write the finding below the prompt. Fold the number into its interpretation (“number and so what”), respect the word cap, and disaggregate by the standard segments where it sharpens the insight.
3. Example line — a worked example in the house voice; delete it once you have written your own.
4. Insight — the qualitative synthesis that closes each section.

Guiding rule: include a metric only where the data supports it and it sharpens an insight — drop anything that does not. Run a statistical test (correlation, significance, confidence interval) only where it makes an insight more decision-useful, not by default. Derived scores (PPI and similar) are calculated upstream and reported here as finished figures.

Standard client segments for disaggregation (where available and where they add insight):

- First-time access vs prior access
- Loan cycle (2–4)
- Caregivers vs non-caregivers
- Female vs male; female HH heads
- PWD households
- Climate-shock-affected vs not
- Savings users; clients receiving other services beyond the loan

Voluntary Savings is reported on its own rather than as a section of the core credit report. It is a distinct product line, it reaches only the MFIs that take client deposits, and so its results are not comparable with the global core credit figures. The data comes from the savings module of the Core Credit survey portal. This wave covers the deposit taking MFIs, which are Bolivia, Ecuador, Mali, Rwanda, Tanzania, and Myanmar. The MFI Index carries no external benchmark for these savings indicators, so no external overlay is shown.

Report Header

Core Credit Impact Report — Global Portfolio, [reporting period]

Covering [N] client responses across [M] VisionFund MFIs in [K] countries. Generated: [date].

Client Profile & Methodology

How to use: Set up the sample and the reading conventions before the themes. Maps to the dashboard's Client Profile page.

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Client Profile — Respondents, MFIs/countries, gender split, age, household size, loan-cycle mix.

Analysis (≤120 words): [Summarise the sample: Give the number of respondents and the number of MFIs and countries, the gender split, age, household size, and the loan cycle mix. Include the profile breakdown by household head status, client education level, and main source of income. State which standard segments

are populated in this wave, and note any conventions about the base that recur later. For example, the coping items cover only clients who met a shock, and the PPI and other worked scores are calculated upstream and reported here as finished figures. Flag any segment that is not available in this wave.]

Benchmarks: Internal regional and global comparisons come from the dashboard. External comparisons come from the MFI Index by 60 Decibels, using the 2025 values where they exist and the 2024 value for the few indicators without a 2025 update. Some indicators have no MFI Index benchmark, such as reporting behaviour, influence in the household, and realized preparedness, and the child wellbeing benchmark cannot be compared with our scale, so leave those overlays out. The MFI Index scores several improvement indicators on a very much basis, so when a benchmark is shown, compare the matching top box figure to keep it like for like.

Executive Summary

How to use. The headline read across all eight themes. The detail lives in the theme sections. This maps to the dashboard Executive Summary scorecard.

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Executive Summary scorecard. *Eight theme scores with the internal regional and global benchmarks and the external MFI Index overlay where it exists.*

Analysis (up to 120 words): [State the eight theme scores at a glance. Where the data exists, state how they compare with the internal regional and global benchmarks, and with the external MFI Index by 60 Decibels. Lead with the two or three themes that carry the strongest impact story, and the one or two that flag a concern. Leave out any benchmark column that has no data.]

Part 1 — Financial Access

How to use. Report whether VisionFund is reaching borrowers who were previously underserved, and how easily clients could turn to another lender. This maps to the dashboard Financial Access page.

1.1 First time access to credit

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: First Time Access. *Share with no prior access to a comparable loan against those with prior access, split by gender.*

Analysis (up to 80 words): [Report the share who had no prior access to a comparable loan before VisionFund. This is the headline inclusion metric. Give it overall and by gender, and note whether women make up more than their share of the clients borrowing for the first time. Bring in female household heads or households with a person with a disability only where it makes the point clearer.]

Example. More than 40 percent of clients had no prior access to a comparable loan before VisionFund. Women make up most of this first time group, which confirms credit as a core inclusion lever for female clients.
[illustrative, replace with your own]

1.2 How easily clients could find another lender

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Access to Alternatives. *How hard or easy it is to find a comparable lending source. The headline joins very difficult and slightly difficult.*

Analysis (up to 70 words): [Report the headline figure for clients who would find it hard to find another lender, joining very difficult and slightly difficult. Read it for the competitive moat, for retention, and for the responsibility that comes with limited competition. Note any pattern by gender or country.]

Example. 45 percent of clients say a comparable lender would be hard to find. This shows limited competition and a strong retention position, and it places a duty on VisionFund to keep terms fair. [illustrative, replace with your own]

Insight for Financial Access (up to 120 words). [Bring the section together in three to five sentences a reader can act on, folding the headline figures into what they mean. Use GenAI assisted theme tagging together with a manual deep dive, and include two or three representative client verbatims with profile (gender, age, branch, loan cycle).]

Part 2 — Poverty Likelihood (PPI)

How to use: Report the poverty profile of the client base from the scored PPI and how it compares to national rates and benchmarks. PPI is calculated upstream; report the finished figures. Maps to the dashboard's Poverty Probability Index page.

2.1 Poverty likelihood across poverty lines

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Poverty Likelihood. Share below the \$1.90 a day, \$2.15 a day, and \$3.20 a day poverty lines, with a benchmark overlay.

Analysis (≤90 words): [Report the share of clients below the \$1.90 a day, the \$2.15 a day, and the \$3.20 a day poverty lines. Interpret what the poverty profile says about who the portfolio reaches, and compare to the regional/global benchmark where available. Note any country or segment concentration worth flagging. Read what the poverty profile says about who the portfolio reaches, and compare it with the benchmark where that exists. Note any country or segment where poverty concentrates.]

Example — 13% of clients fall below the \$1.90/day (2011 PPP) line, in line with the regional benchmark, indicating a moderately poor client base with pockets of deeper poverty in [country]. [illustrative — replace with your own]

2.2 The MFI against the national poverty rate

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: MFI vs National Poverty Rate. Poverty likelihood of the client base set against the national rate, by country.

Analysis (up to 70 words): [Compare the poverty likelihood of the client base with the national rate for each country served. Note where VisionFund reaches a client base that is poorer than the national average, which shows stronger targeting of the poor, and where the opposite holds.]

Example. In [country] clients are poorer than the national average, which is evidence of targeting the poor. In [country] the reverse holds, which is worth examining against the branch mix. [illustrative, replace with your own]

Insight for Poverty Likelihood (up to 120 words). [Bring the section together in three to five sentences a reader can act on, covering who the portfolio reaches and what that means for targeting. Name the poverty lines used and any country that stands out.]

Part 3 — Business & Household Impact

How to use: Report how the loan changed business income and household quality of life, and mine the free text for what drove the change. Maps to the dashboard's Business and Household Impact page.

3.1 Business income change

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Business Income. Share whose business income improved against no change or worse, by gender.

Analysis (≤80 words): [Report the share whose business income increased since engaging with VisionFund (top-box), including the share whose business income rose since they engaged with VisionFund, using the top two boxes (very much and slightly improved), the same basis as quality of life below. Give the gender pattern and any gradient across loan cycles. Later cycles should show more improvement, so flag it if they do not. When you overlay the MFI Index, compare the very much figure, since that is how the index is scored.]

***Example.** A large majority report higher business income since their VisionFund loan, and the share rises with each loan cycle. This suggests that repeat borrowing compounds the income effect. [illustrative, replace with your own]*

3.2 Change in quality of life

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Change in Quality of Life. Very much improved and slightly improved against no change or worse, by gender.

Analysis (up to 80 words): [Report the share who report an improved quality of life, using the top two boxes (very much and slightly improved). Give the gender split and any segment that stands out, and tie it back to business income above.]

***Example.** 93 percent of clients report an improved quality of life, split between very much improved and slightly improved, and women and men sit close together. [illustrative, replace with your own]*

3.3 What drove the improvement

Qualitative (GenAI plus manual deep dive). Theme tag the quality of life free text, covering how it improved, why it did not change, and how it became worse. List the leading themes with a rough frequency and two or three representative verbatims. Keep what the loan drove, such as income, school fees, and assets, apart from unmet needs and concerns.

Insight for Business and Household Impact (up to 120 words). [Bring the section together in three to five sentences a reader can act on, folding the income and quality of life figures into what they mean. Include two or three verbatims with profile (gender, age, branch, loan cycle).]

Part 4 — Child Wellbeing

How to use. Report improved child wellbeing and what specifically improved, then test the difference between caregivers and other clients. This maps to the dashboard Child Wellbeing page.

4.1 Improved child wellbeing and what improved

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Child Wellbeing / Child Wellbeing Outcomes. Share of caregivers who report improved child wellbeing, and the ranked list of what improved.

Analysis (up to 90 words): [State the share of caregiver clients who report improved child wellbeing. Rank the top items that improved, such as healthcare access, nutrition, fewer missed school days, and supplies. Where a correlation makes the story clearer, name the item most associated with improvement and explain the pathway, for example higher income leading to school fees and then to wellbeing.]

Example. A third of caregivers report improved child wellbeing, most often through better nutrition and fewer missed school days. This points to income smoothing as the lever to strengthen. [illustrative, replace with your own]

4.2 Caregivers against other clients

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Caregivers vs Non Caregivers. *Shared outcomes compared across caregivers and other clients.*

Analysis (up to 80 words): [Compare caregivers with other clients across the shared outcomes in the table below, which cover quality of life, financial worry, community respect, business income, loan goal achievement, household influence, savings, and the Net Promoter Score. Report both rates and the gap. Report significance only where it makes the point clearer. Note whether caregivers are reaching the households that most need a buffer.]

Outcome	Caregiver %	Non-caregiver %	Gap (sig?)
Improved quality of life	[]	[]	[]
Financial worry decreased	[]	[]	[]
Improved community respect	[]	[]	[]
Improved business income	[]	[]	[]
Loan goal achieved	[]	[]	[]
Improved household influence	[]	[]	[]
Increased savings	[]	[]	[]
Net Promoter Score	[]	[]	[]

Insight for Child Wellbeing (up to 120 words). [Bring the section together in three to five sentences a reader can act on. Fold in the child wellbeing share and the widest caregiver gap. Include two or three verbatims with profile.]

Part 5 — Client Protection

How to use. *Report the client protection indicators and surface any signal of poor conduct or hardship, including the ones that sit in the free text. Flag any signal of poor conduct or harm clearly, however low the volume. This maps to the dashboard Client Protection page.*

5.1 Financial worry

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Financial Worry. *Share whose time spent worrying about finances fell since the loan.*

Analysis (up to 70 words): [Report the share whose financial worry fell since they borrowed. Note any segment, such as clients affected by a shock or female household heads, where worry did not ease.]

5.2 Clarity of loan terms

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Understanding of Loan Terms. *Share who find fees, interest rates, and penalties easy to understand.*

Analysis (up to 70 words): [Report the share who find VisionFund fees, interest rates, and penalties easy to understand and clear. Flag any pattern by education or country, because low clarity carries a risk of misselling and of clients taking on too much debt.]

5.3 Complaints mechanism

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Complaints Handling Mechanism. *Share who feel they can complain safely, at no cost, and easily.*

Analysis (up to 70 words): [Report the share who feel they can raise a complaint safely, at no cost, and in a way that is easy for them. A low figure is a client protection gap.]

5.4 Fair treatment & reporting

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Fair Treatment / Reporting Behavior — *Share who experienced no unfair treatment; of those who did, whether they reported it.*

Analysis (≤80 words): [Report the share who experienced no harassment, unwanted pressure, or unfair treatment from a VisionFund representative; among those who did, report whether they felt able to report it. Treat unfair-treatment incidents and non-reporting as a conduct signal for follow-up, even at low volume.]

5.5 Reduced food intake to service the loan

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Reduced Food Intake — *Share who did NOT change household food to make repayments (top-box).*

Analysis (≤80 words): [Report the share who did NOT reduce household food to make repayments (top-box), and quantify those who did (reduced meals, portion sizes, borrowed food) — a core over-indebtedness / client-protection flag; note any segment concentration]

Example — *90% did not change household food to service their loan; the minority who reduced meals or portion sizes concentrate among [segment] — a client-protection flag that warrants follow-up. [illustrative — replace with your own]*

Client protection signals (free text)

Qualitative (GenAI + manual deep dive): Theme-tag the free text on unfair treatment and harassment, together with any related complaint text. Group the signals into high, medium, and low severity, the same way the insurance report did. Because core credit runs at roughly three times the volume of insurance, cap what is shown to the most serious items in each tier, for example the top three to five, each with a short client profile and a count. Flag any issue of staff conduct, coercion, or misselling on its own and clearly, however few. These are surfaced as signals, not as counts to lean on.

Insight for Client Protection (up to 120 words). [Bring the section together in three to five sentences a reader can act on. Lead with the strongest protection indicator, and with any signal of conduct that needs follow up. Include two or three verbatims with profile.]

Part 6 — Agency

How to use: Report the loan's effect on clients' goals, household influence, and standing in the community. Maps to the dashboard's Agency page.

6.1 Achievement of the loan's purpose

[DASHBOARD VISUAL — paste screenshot here]

PowerBI visual: Achievement of Loan's Purpose. *Share who achieved the purpose they took the loan for.*

Analysis (≤70 words): [Report the share who achieved the purpose they took the loan for giving the fully achieved and the partially achieved shares separately. Note the leading loan purposes and any pattern by segment or loan cycle.]

Example. [X] percent of clients fully achieved the purpose of their loan and a further [Y] percent achieved it in part, with later loan cycles more likely to report full achievement. [illustrative, replace with your own]

6.2 Influence over household decisions

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Household Influence. *Share whose influence over household resource decisions improved, by gender.*

Analysis (up to 80 words): [Report the share whose influence over household resource decisions improved. Lead with the gender read, because this is a core measure of women's empowerment, and describe what changed, drawing on the free text where it helps.]

6.3 Respect in the community

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Respect in the Community. *Very much improved and slightly improved against no change or worse, by gender.*

Analysis (up to 70 words): [Report the share who report improved standing in the community, using the top two boxes. Give the gender split and any country that stands out.]

Example. 74 percent report improved standing in their community, and men sit slightly ahead of women. This is a broad signal of social empowerment. [illustrative, replace with your own]

Insight for Agency (up to 120 words). [Bring the section together in three to five sentences a reader can act on, covering goal achievement and empowerment, and lead with the gender read. Include two or three verbatims with profile.]

Part 7: Resilience

How to use. Report the change in savings and how clients withstood and recovered from shocks, and the part VisionFund played in softening them. Give special attention to negative coping. This maps to the dashboard Resilience page.

7.1 Change in savings

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Savings. *Share whose savings rose since they took the loan.*

Analysis (up to 70 words): [Report the share whose savings rose since they took the loan. Note any gradient across segments and the link to resilience below.]

7.2 Shocks and their impact

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Incidence and Impact of Shocks. *Share who met a shock in the last 24 months, and the main impacts.*

Analysis (up to 80 words): [Report the share of clients and communities that met a shock in the last 24 months, and the main impacts on income, assets, and health. Note where it concentrates by geography or climate exposure.]

7.3 Coping mechanisms

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Coping Mechanism and Realized Preparedness. *Coping mechanisms across segments, with negative coping flagged.*

Analysis (up to 90 words): [Report the main coping mechanisms and quantify negative coping, such as cutting food or essential spending, selling assets or livestock, taking children out of school, and migration. Flag whether it concentrates in any segment, such as clients affected by a shock, female household heads, or households with a person with a disability. This is a client protection signal. Fold in the free text on other coping.]

Example. 27 percent used savings and 24 percent borrowed to cope, but a notable minority cut essential spending or sold assets, concentrated among [segment]. This is a resilience gap to watch. [illustrative, replace with your own]

7.4 Effect of VisionFund on the severity of the shock

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Effects of VFI's Services on Climate Shock. *Share who said VisionFund services reduced the severity of the shock.*

Analysis (up to 70 words): [Report the share who said VisionFund services reduced the severity of the shock, joining significantly and somewhat. Read it as realized preparedness, the resilience dividend that comes with access.]

Example. 57 percent said VisionFund softened the impact of the shock. This is evidence that access itself builds preparedness. [illustrative, replace with your own]

Insight for Resilience (up to 120 words). [Bring the section together in three to five sentences a reader can act on. Fold in savings, the share who faced a shock, and the negative coping flag. Include two or three verbatims with profile.]

Part 8: Client Satisfaction

How to use. *Report the NPS story and what drives promoters and detractors. This maps to the dashboard Client Satisfaction page.*

8.1 NPS and the split

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Net Promoter Score. *Headline NPS and the split into promoters, passives, and detractors, by gender.*

Analysis (up to 80 words): [Report the headline NPS and the split into promoters, passives, and detractors, and the gender pattern. Note any country that clearly does better or worse than the rest.]

Example. The NPS stands at 69, with 75 percent promoters, 18 percent passives, and 6 percent detractors. Women promote a little more than men. [illustrative, replace with your own]

8.2 What drives recommendation and dissatisfaction

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Drivers of Client Satisfaction. *Top promoter drivers and top detractor pain points.*

Analysis (up to 90 words): [Rank the top promoter drivers and the top detractor pain points. Theme tag the NPS follow up text, split by the score bands of 9 and 10, then 7 and 8, then 0 to 6. Name the single fix with the most leverage.]

Qualitative (GenAI plus manual deep dive). Client voices, green lights and red flags. Give representative verbatims grouped into promoters, passives, and detractors, each with profile. Lead with the green light themes that recur, then the red flags that detractors raise most.

Insight for Client Satisfaction (up to 120 words). [Bring the section together in three to five sentences a reader can act on. Fold in the NPS and the top driver on each side, and name the fix with the most leverage. Include two or three verbatims with profile.]

Gender

How to use. *Bring the female and male cut of every key metric where a gap matters into one scorecard, then narrate the gaps. This is the gender story for the whole report. Tie it back to Financial Access in Part 1 and to Client Satisfaction in Part 8. The other segments are broken out inside each theme. Gender is pulled out here because it is the single strongest equity story.*

Metric (gender scorecard)	Female %	Male %	Gap (significant?)
No prior access, first time borrower	[]	[]	[]
Finds another lender hard to find	[]	[]	[]
Business income improved	[]	[]	[]
Quality of life improved	[]	[]	[]
Improved child wellbeing	[]	[]	[]
Financial worry fell	[]	[]	[]
Loan terms easy to understand	[]	[]	[]
No unfair treatment met	[]	[]	[]
Cut food to repay (lower is better)	[]	[]	[]
Loan purpose achieved	[]	[]	[]
Household influence improved	[]	[]	[]
Community respect improved	[]	[]	[]
Savings rose	[]	[]	[]

VisionFund reduced shock severity	[]	[]	[]
Promoter on NPS	[]	[]	[]

Analysis (up to 100 words): [Summarise where women do better or worse than men, and only where the gap matters. Test it where that makes the point clearer. Draw out what it means for equity and the clearest action. Tie it back to first time access in Part 1 and to satisfaction in Part 8.]

***Example.** Women lead on first time access and on quality of life, but they trail on [metric] at [F] percent against [M] percent. This makes [action] the clearest equity move. [illustrative, replace with your own]*

Insight for Gender (up to 120 words). [Bring the section together in three to five sentences a reader can act on, covering the gender story for the whole report. Include two or three verbatims with profile.]

Client Voices

How to use. A curated bank of representative verbatims from across the report, grouped by NPS category, each tagged with the client profile. Lead with the green light themes that recur, then the red flags that detractors raise most. These illustrate rather than measure, so keep the profile tags accurate and let the voices carry the qualitative story. This maps to the dashboard Client Voices page.

[DASHBOARD VISUAL. paste screenshot here]

PowerBI visual: Client Voices. Verbatims by client category (promoter, passive, detractor) with profile and branch.

Green lights (promoters): [two or three verbatims, each with gender, age, branch, loan cycle, and segment]

Red flags (detractors): [two or three verbatims, each with profile. Flag any protection signal so it can be linked to Part 5]
